

Date 20 Nov. 2016. Black Sugarloaf, Birrallee (big tree track).

Habitat: Closed wet Eucalypt forest.

Substrate decayed *Pomaderris apetala* on the ground.

Description several clusters of crowded stalked fuscous brown sporangia 6–9 mm high. **Sporotheca** cylindrical, erect and drooping, fuscous brown, 0.4 mm diameter. **Stalk** back, shiny, < 1/3 height of sporangia. **Hypothallus** contiguous under group, membranous, colourless. **Peridium** fugacious.

Columella reaches to almost the apex of sporotheca.

Capillitium arises from full length of columella, 2–3 meshes between columella and periphery, membranous expansions; surface net of thin threads with small angular meshes. **Spores** brown in mass, reticulate, 7.5–9 µm.

Notes: common species at Black Sugarloaf.
